BACKGROUND
Retinol binding protein (RBP) is from a family of structurally related proteins that bind small hydrophobic molecules such as bile pigments, steroids, odorants, etc\(^1\). RBP is a 21 kDa highly conserved, single-chain glycoprotein, consisting of 182 amino acids with 3 disulfide bonds, that has a hydrophobic pocket which binds retinol (vitamin A). The structure of retinol is shown below.

RBP binds retinol in a 1:1 stoichiometry, which serves to not only solubilize retinol but also protect it from oxidation. When in serum, the majority of RBP bound with retinol is reversibly complexed with transthyretin (prealbumin)\(^2\). This complex then transports retinol to specific receptors of various tissues in the body. Vitamin A status is reflected by serum concentration as it is hemo- statically controlled and does not fall until stores are dramatically reduced\(^3-4\).

RBP has been shown to be a useful surrogate marker for retinol because of the approximate 1:1 (molar) correlation between retinol and RBP in serum\(^1-5,6\), which implies that RBP may be used to assess and monitor vitamin A deficiency (VAD) in populations. The World Health Organization has estimated that 250 million children have moderate to severe VAD\(^7\) due to lack of adequate nutrition, and the rising cost of food staples around the world further exacerbates this problem. In addition to nutritional deficiencies, infectious stresses have been shown to depress retinol concentrations. Therefore, individuals with diseases such as cystic fibrosis\(^8\) and HIV-1\(^9\) also run the risk of VAD due to the infectious stresses that contribute to the disease.

ASSAY PRINCIPLE
The DRG Retinol Binding Protein (RBP) kit is designed to quantitatively measure RBP present in serum and plasma samples. Please read the complete kit insert before performing this assay. A RBP standard is provided to generate a standard curve for the assay and all samples should be read off the standard curve. Standards or diluted samples are pipetted into a clear microtiter plate coated with an antibody to capture rabbit antibodies. A RBP-peroxidase conjugate is added to the standards and samples in the wells. The binding reaction is initiated by the addition of the RBP polyclonal antibody to each well. After an hour incubation the plate is washed and substrate is added. The substrate reacts with the bound RBP-peroxidase conjugate. After a short incubation, the reaction is stopped and the intensity of the generated color is detected in a microtiter plate reader capable of measuring 450nm wavelength. The concentration of the RBP in the sample is calculated, after making a suitable correction for the dilution of the sample, using software available with most plate readers.

REAGENTS
Retinol Binding Protein Tri-Level Controls for Low, Medium and High level human RBP in Serum For Quality Control and assay performance testing

MATERIALS SUPPLIED
- **Coated Clear 96 Well Plate** One Plate
  A clear plastic microplate with break-apart strips coated with goat anti-rabbit IgG.
- **RBP Standard** 60 µL
  A stock solution of native human RBP at 100 µg/mL.
- **RBP Antibody** 3 mL
  A polyclonal antibody specific for RBP.
- **RBP-Peroxidase Conjugate** 5 mL
  An RBP-peroxidase conjugate.
- **Assay Buffer** 28 mL
- **Wash Buffer Concentrate** 30 mL
  A 20X concentrate that should be diluted with deionized or distilled water.
- **TMB Substrate** 11 mL
- **Stop Solution** 11 mL
  A 1N hydrochloric acid solution. Caustic.
• Plate Sealer 1 each

STORAGE INSTRUCTIONS
All components of this kit should be stored at 4 °C until the expiration date of the kit.

OTHER MATERIALS REQUIRED BUT NOT SUPPLIED
• Distilled or deionized water.
• Repeater pipet with disposable tips capable of dispensing 25 µL, 50 µL and 100 µL.
• A microplate shaker and washer.
• Colorimetric 96 well microplate reader capable of reading optical density at 450 nm.
• Software for converting raw relative optical density readings from the plate reader and carrying out four parameter logistic curve (4PLC) fitting.

PRECAUTIONS
As with all such products, this kit should only be used by qualified personnel who have had laboratory safety instruction. The complete insert should be read and understood before attempting to use the product.

The antibody coated plate needs to be stored desiccated. The silica gel pack included in the foil Ziploc bag will keep the plate dry. The silica gel pack will turn from blue to pink if the Ziploc has not been closed properly.

The RBP Standard is purified from a human source and as such, should be treated as potentially hazardous. Proper safety procedures must be followed.

This kit utilizes a peroxidase-based readout system. Buffers, including other manufacturers Wash Buffers, containing sodium azide will inhibit color production from the enzyme. Make sure all buffers used for samples are azide free. Ensure that any plate washing system is rinsed well with deionized water prior to using the supplied Wash Buffer as prepared on Page 4.

The Stop Solution is acid. The solution should not come in contact with skin or eyes. Take appropriate precautions when handling this reagent.

SAMPLE TYPES
This assay has been validated for human serum and EDTA and heparin plasma samples only. Samples containing visible particulate should be centrifuged prior to using. Moderate to severely hemolyzed samples should not be used in this kit. They have been shown to yield artificially high RBP concentrations.

For detecting RBP in urine samples please refer to the Urinary Retinol Binding Protein Immunoassay kit, that is 10 times more sensitive than this serum kit.
RBP is a highly conserved protein and we have shown that the Urinary RBP kit, which uses identical antibody and conjugate, will measure RBP's from sources other than human including rat, dog and rhesus monkey. The end user should evaluate recoveries of RBP in other plasma and serum samples being tested.

**SAMPLE PREPARATION**

Samples must be diluted 1:40 by taking one part of serum and adding thirty-nine parts of Assay Buffer prior to running in the kit. Any samples with RBP concentrations outside the standard curve range should be diluted further with Assay Buffer to obtain readings within the standard curve.

Use all samples within 2 hours of dilution.

**REAGENT PREPARATION**

Allow the kit reagents to come to room temperature for 30 minutes. The recommended format is 1 hr at room temperature with shaking. The assay is sensitive to temperature. Significant changes to temperature during incubation will cause results to vary. We recommend that all standards and samples be run in duplicate to allow the end user to accurately determine RBP concentrations. Ensure that all samples have reached room temperature and have been diluted as appropriate prior to running them in the kit.

**Wash Buffer**

Dilute Wash Buffer Concentrate 1:20 by adding one part of the concentrate to nineteen parts of deionized water. Once diluted this is stable for 3 months at room temperature.

**Standard Preparation**

Label seven glass test tubes #1 through #7. Briefly spin vial of standard in a microcentrifuge to ensure contents are at bottom of vial. Pipet 475 µL of Assay Buffer into tube #1 and 250 µL into tubes #2-#7. Carefully add 25 µL of the RBP Standard stock solution to tube #1 and vortex completely. Take 250 µL of the RBP solution in tube #1 and add it to tube #2 and vortex completely. Add 250 µL of tube #2 to tube #3 and vortex completely. Repeat these serial dilutions for tubes #4 through #7. The concentration of RBP in tubes 1 through 7 will be 5, 2.5, 1.25, 0.625, 0.313, 0.156 and 0.078 µg/mL.

Use all Standards within 2 hours of preparation.
ASSAY PROTOCOL

1. Use the plate layout sheet on the back page to aid in proper sample and standard identification. Determine the number of wells to be used and return unused wells to foil pouch with desiccant. Seal the ziploc plate bag and store at 4°C.

2. Pipet 25 µL of samples or standards into wells in the plate. Pipet 50 µL of Assay Buffer into the non-specific binding (NSB) wells. Pipet 25 µL of Assay Buffer into wells to act as maximum binding wells (B0).

3. Add 50 µL of the RBP-peroxidase conjugate to each well, using a repeater pipet.

4. Add 25 µL of the RBP Antibody solution to each well, except the NSB wells, using a repeater pipet.

5. Gently tap the sides of the plate to ensure adequate mixing of the reagents. Cover the plate with the plate sealer and shake at room temperature for 1 hour.

6. Aspirate the plate and wash each well 4 times with 300 µL wash buffer. Tap the plate dry on clean absorbent towels.

7. Add 100 µL of the TMB Substrate to each well, using a repeater pipet.

8. Incubate the plate at room temperature for 15 minutes.

9. Add 100 µL of the Stop Solution to each well, using a repeater pipet.

10. Read the optical density generated from each well in a plate reader capable of reading at 450 nm.

11. Use the plate reader's built-in 4PLC software capabilities to calculate RBP concentration for each sample.

CALCULATION OF RESULTS

Average the duplicate OD readings for each standard and sample. Create a standard curve by reducing the data using computer software capable of generating a four-parameter logistic curve (4PLC) fit, after subtracting the mean OD's for the blank. The sample concentrations, calculated off the %B/B0 curve, should be multiplied by the dilution factor to obtain neat sample values.
